Project Name: Mini Feature Phone

We have made a project named simple feature phone. It is done with the help of C programming language.

Motivation:

Our motive was to lessen the dependency on many devices at a time. Everyday, we need a calculator for calculating something, a stopwatch for performing a task within a fixed time, a calendar to see the date of a day, a phone book for saving someone's contact number if it is needed to contact with that person in future. If a person needs all of these at a time for his daily purposes, he will surely buy these devices for respective task. But, our project has some features which will perform all the task of daily necessary devices like calculator, stopwatch, calendar, phone book. This is why we both decided to make such a project which will perform these tasks like a Nokia feature phone.

Features: Our project has five necessary features like :

Calendar: User can find out any particular year's calendar.

Calculator: User can do addition, subtraction, multiplication and division of any two numbers.

Stopwatch: Giving a time to be ended, user also can use this feature.

Phone Book: User can add a new contact, search a particular saved contact, delete a existing contact and view all the existing contact in the phone

Game: In this feature, user is given a chance of entertainment through some basic general knowledge based question.
